Root Canal vs. Tooth Extraction

by Henry Tyler

Article published on August 9th 2012 | Health

In the past whenever a tooth was past salvaging the sole alternative was to tug your tooth out. This is what is called teeth extraction or exodontia, or perhaps the dentist propped up on the dental chair over the affected person pulling with all his might on the tooth which has an extreme stranglehold.

But until lately, a different easier, less strenuous and relatively less agonizing substitute appeared. This is accomplished with just several electric zips and zaps on the nerves of the quite sickly tooth to kill them. And even though the tooth is only just a prop now and has hardly any other use other than to sit there and stay pretty, the good thing is there is no vacuum anymore in between teeth which a tooth extraction would have left. This is typically known as root canal.

Showdown

You might think that tooth extraction could have long gone extinct nowadays since root canal has wiped out all those extraction messes. But tooth extraction still has its uses and several people still prefer having their tooth repaired the old way.

So now we have a showdown. Root canal or tooth extraction?

Benefits of tooth extraction

Because tooth extraction only happens in only one sitting, many individuals still choose this old fashioned method. The nearby gum is numbed with local anesthesia. Employing a pair of forceps, the tooth is rocked to and fro. Once it is loose enough, the tooth is removed in one quick and smooth move. Then you could have that ubiquitous ice cream right after to prevent swelling.

Needless to say in some cases, the tooth is just too tenacious being just rocked back and forth, where there comes the dentist propped on the chair yanking on the tooth like itâ€™s Excalibur. However we jest, and thatâ€™s merely in extraordinary instances of obstinate teeth.

Cheaper

Also tooth extraction is a whole lot less expensive than having many visits of root canal where one session is a lot more costly when compared to a solitary sitting of exodontia. And, for people with HMO, a few health cards only offer tooth removal for their free services.

Benefits of root canal

But some of your Chandler dentists would probably explain how despite the fact that tooth extraction is significantly cheaper at first, in the long run a root canal is a lot more cost-effective. And if you canâ€™t have confidence in Chandler dentist, who do you trust?

The thing with teeth is the fact that once they sense an empty space they have a tendency to veer in the direction of it. When this occurs, the teeth become misaligned, there turns into a bad bite, and since they've become much looser there are far more chances of problems. Ultimately, when there is space in between teeth, itâ€™s advised either way to have a dental implant to fill it.

And why would you possess a phony and imposturous tooth if you can have your very own authentic tooth to stay in your mouth? Think about it.

Many people grumble that root canal is painful. However like having your teeth go in for a filling, the only thing painful to it is the soreness of your jaw bone after keeping your mouth wide open for a long period. Plus the success rate of root canal is more than 95%.

But occasionally, even if you want the root canal method there are instances when the tooth is really past saving. When a tooth is suffering from extensive deterioration the structure is jeopardized and no level of zapping the nerves can save it. Then, no choice, tooth extraction it is.
