The Benefits of Laser-Assisted Cosmetic Surgery by Jacintohukle

Article published on May 17th 2012 | Health

Cosmetic surgery continues to develop as the demand for it increases year after year. People who opt to undergo the procedure tend to look for safe and less painful options, which are fortunately available in todayâ€™s medical offices because of the advent of laser-assisted surgeries. This new technique has gained popularity and a good reputation for the benefits it presents to both patients and surgeons.

Accuracy

Whether contained or invasive, a cosmetic surgical procedure may involve incisions that could potentially damage functional tissues and later lead to untreatable complications. In fact, many patients tend to back out after being informed of the risk they are about to face. With laser used to make incisions instead of the traditional scalpel, cuts can be more accurate, which significantly reduces the risk of damaging surrounding organs or tissues.

Safety

The electromagnetic radiation emitted by laser is cleaner and safer for incisions compared to solid tools since it cannot be contaminated by bacteria. It has the property to thwart or kill bacteria instantly upon contact. Any laser-assisted surgical procedure is guaranteed clean and safe, which not only translates to the success of the procedure but to a problem-free post-operative stage as well.

Fast Recovery

The success of a cosmetic surgical procedure is measured not only by the efficiency of the actual operation but more importantly by the rate of recovery during the post-operative stage. While it is the patientâ€™s responsibility to look after his or her own recovery, the surgical method also plays an important role in making the recovery as quick and painless as possible. With laser-assisted surgery, the patient has a guaranteed faster recovery compared to typical surgeries.

Less Bleeding

Bleeding is a natural occurrence when the skin is incised but this can be minimized with the help of laser. For instance, laser-assisted cosmetic surgeries like laser lipo Utah patients prefer covers the same area typical liposuction does, but the bleeding is more controlled. This reduces the chance of developing hematoma after the procedure.

No Sutures

Incision wounds are usually closed by sutures. On the other hand, laser has the ability to close the wounds it creates due to its high irradiance. This facilitates faster recovery of the patient, whether it is lipo or Utah laser hair removal.
