Article published on June 7th 2012 | Health

A dental implant is a root device, usually made of titanium, used in dentistry to support restorations that resemble a tooth or group of teeth to replace missing teeth. Dental implants are long-lasting tooth root replacements that oral surgeons implant into the jawbone to simulate the root of a pre-existing tooth. A dental implant is a prosthetic replacement for a missing tooth. Natural teeth consist of the crown and the root. The root is the part of the tooth that is effectively replaced by an implant. The dental implant is placed into the jawbone and serves as a secure root for the new tooth.
