What is Glycolic Acid Peel by [Nicoleflourweens](#)

Article published on December 15th 2011 | [Health](#)

Glycolic acid peel doesn't need any introduction to those who are in skin care business or who are conscious of their appearance and regularly take care of their skin problems. Our skin is damaged due to many reasons including aging, over exposure to the sun, acne, acne removal scars, etc. Many things work very negatively on our skin and affect our appearance. When such skin deformities happen on the face, neck or hands, they become a source of embarrassment since they are the more visible parts of our body. Glycolic acid peel is one of the best methods to deal with most of the common skin problems that are observed especially on the face, neck, chest and hands.

Glycolic acid peel is the most popular form of chemical peels to treat skin deformities. It is highly preferred since glycolic acid is a natural compound that is extracted from sugar cane. It is widely used in many skin care products. Glycolic acid literally removes the outer skin layer to expose the layer underneath. When the superficial skin layer is removed, it takes away with it fine lines, mild scars, wrinkles, blemishes, etc. Most of the skin imperfections can completely be eliminated or reduced considerably with the treatments of glycolic acid peel.

Another factor that makes glycolic acid peel more and more popular is its short duration of treatment. Due to this reason, it is also referred as "lunch time peel." Yes, it can be done in a period as short as your lunch break and that you can return to your normal activities soon after the treatment. This is considered one of the points that favor its fast growing popularity. People who are unable to spare time to correct aging signs like wrinkles, fine lines, and other skin abnormalities through any time-taking procedure, turn to glycolic acid peel as the quick answer to their problems.

Glycolic acid peel suits many skin types and it is considered the safest mean to treat skin problems. It can be done at any dermatologist's office, spa, or even at home by an experienced individual. Although it is considered the safest kind of skin treating method, you should get the required information before attempting to do it by yourself. Furthermore, before you try the acid on the entire face, do some spot test to ascertain you have no adverse reactions to the peel. If some precautions are followed, the results will be highly encouraging.
