What is Hair Restoration Surgery and How This Method Help Bald People? by Jhoanne031

Article published on January 3rd 2012 | Health

A lot of people are very disturbed when it comes to hair loss, especially those men who are continually balding. Many of them are also looking for ways on how to prevent this event. Since the modern way of technology today, this is not a problem anymore. There is a massive development when it comes to treating hair loss and this is through hair surgery.

Hair restoration surgery is a procedure to bring back the hair development to your scalp that has already patches due to baldness that is proven to be hard to cure with non-surgical alternatives. This method involves choosing parts of your scalp that have healthy hair development. These parts will be employed as the contributors for the areas that have no hair development. When the selection is done, you are then administered with a contemporary anesthetic and sedatives that is used to your scalp.

The contributor skin on your scalp is properly cut out and each follicle is removed. This procedure is accomplished with the use of some micro care medical tools, including some microscopes to improve visibility. Once each of the follicles in your hair has been removed from the contributor skin, the part to get the hair follicles is then penetrated holes. Placement of the follicles into penetrated holes follows some prearranged pattern that also follows the original pattern of your hair.

Once the follicles have been planted on the patched areas, you will be given with anticoagulants, antibiotics and other medicines that put off elimination of donated follicles. Even though you undergone hair replacement surgery, the development of your hair does not take place instantly after the procedure. As a matter of fact, the hair that was transplanted will begin to fall out days after the hair surgery. Still, you do not have to be troubled for it is meant to be that way.

In addition, when all the hair that was transplanted has been falling out, the follicles that were planted in your scalp will begin to adjust to its new places after a period of almost two months. The planted hair follicles will also begin to make hair strands at this time. It is recommended that you do not expose your scalp to direct sunlight during this critical period. As you gone through with hair restoration surgery, this method can also increase the development of your hair from planted follicles by using medicines that can accelerate hair development.
