It is, in many ways unsurprising that hair removal using laser technology has surpassed electrolysis in terms of popularity in recent years. Electrolysis is the only other permanent hair removal treatment available, however, it is known for being slow (it only targets one hair at a time), as well as very painful. Electrolysis, like laser hair removal surgery, targets the hair's follicle, a small metal probe is inserted into the follicle and an electric current which kills the hair is delivered, unsurprisingly this can be a very slow process and because of this, large areas of hair, such as the legs can take years to treat. Laser hair removal surgery is far quicker than electrolysis because it can target multiple hairs, patients also report that undergoing laser hair removal treatment is an almost painless experience, although occasionally the sensation can be likened to having an elastic band flicked against the skin.

Laser hair removal utilises the very latest technology, and either results in permanent or long lasting hair removal for patients. Laser hair removal is only suitable for those with dark hair, as because the laser is drawn to the dark pigment (also known as melanin) in the hair it does not work on blonde or white hairs which contain no dark pigment. Because the laser is drawn towards the dark pigment, laser hair removal is not always suitable for people with dark skins, though your laser hair removal practitioner will be able to advise you further. Laser hair removal has become a highly sought after treatment on Harley Street, London, and surgeons attribute this popularity to the speed and painlessness of laser hair removal, pointing out that there is no other quick, painless and long lasting hair removal treatment on the market. Experts in laser hair removal on Harley Street in London point out that while laser hair removal treatment is now very widely available; patients ought to choose their laser practitioner very carefully. This is because an unqualified or inexperienced laser hair removal practitioner is unlikely to get very good results, and there is a risk that they could burn the patient's skin with the laser.

The majority of patients will need 6 - 8 laser hair removal sessions, and these will each last about thirty minutes (though this will vary depending on the size of the area, and very small areas may take as little as ten minutes.) Laser hair removal is suitable for use on all external areas of the body, including the face and bikini line, though the inside of the nose and ears cannot be treated using laser hair removal.
