Winstrol Depot by DESMA/Zambon, Spain is an injectable steroid which contains 50mg per ML of stanozolol suspended in water.

Some bodybuilders claim that the injectable version of this steroid yields better results than does the oral version. The water base of this substance means that it gets into the system very quickly, therefore requiring frequent injections to keep blood levels stable and consistent. Bodybuilders often inject Winstrol Depot everyday for best results. Winstrol (Stanozolol) is one of the most popular steroids in use today. This steroids has very low androgenic properties and very high anabolic properties. Winstrol Depot (Stanozolol) does not have the ability to aromatize and therefore will not cause any water bloat. This has made this steroid very popular with bodybuilders in the cutting phase of their training.

Winstrol Depot is generally used in a cutting cycle rather than in the heavy bulking up cycle. Achieving defined muscles and losing excess fat is the goal of a cutting cycle and anabolic steroids such as Winstrol Depot or Primobolan Depot are popular choices. These steroids are popularly stacked with a testosterone-based steroid during this cycle. Winstrol Depot does aromatize and produce estrogen which helps alleviate the need for taking an anti-estrogen, doesnâ€™t promote water retention, and appears to have a very high protein synthesizing feature which produces and preserves the lean muscle with the more limited pre-contest dietary restrictions.

Winstrol Depot may be used by athletes for whom strength and speed are desirable. This is because the weight gain that accompanies some other anabolic steroids is not present in Winstrol, instead lean muscle mass is built. However, one Winstrol Depot side effect that has been reported is that of sore joints. If strength and speed are vital to the athlete then the complaints of joint pain by some may sway an athlete with a need for speed, and joint looseness in favor of another anabolic steroid such as Primobolan Depot.

The substance stanozolol is a precursor to the dihydrotestosterone and consequently, it prevents Winstrol Depot from aromatizing into estrogens with water retention occurring only rarely. Based on these characteristics the main application of Winstrol Depot is clearly defined in bodybuilding: preparation for a competition. Together with a calorie-reduced diet which is rich in protein Winstrol Depot gives the muscles a continuously harder appearance. Winstrol Depot is usually not used as the only steroid during dieting since, based on its low androgenic component, it does not reliably protect the athlete from losing muscle tissue. The missing, pronounced, androgenic effect is often balanced by a combined intake with Parabolan. The combination of Winstrol Depot 50 mg/day and Finaject 30 mg/day, until a few years ago, was the competition stack.

Due to its low androgenic activity, Winstrol Depot (Stanozolol) is a very good choice for women bodybuilders. Males typically use Winstrol Depot (Stanozolol) in dosages of 50-100mgs a day for a period of 6-8 weeks. 5-10mg a day for a period of 4-6 weeks is the normal dosage range for women.
