# Preservation Ideas to Maintain Your Septic System Working Efficiently by Lexoremman

Article published on May 24th 2012 | Home

Consider the septic system like a car. Having frequent maintenance, fluid changes and system inspections on your vehicle, it could possess a duration of 20-30 years. Precisely the same goes regarding your septic system. Regular Upkeep and Check ups will find troubles at the start of their phases, and enable you to resolve those issues before they result in a system malfunction, possibly saving you lots of money in replacement cost. Here are a few maintenance ideas to keep the septic system running efficiently for many years.

Keep your Septic System pumped often.

The typical house must have the septic tank pumped out every 3 to 5 years. Without frequent system pumping, solids might overload the Septic tank and sludge might leach into the drainfield. Drainfield effluent ought to be free from these solids to maintain the system running cleanly.

Move all access runoff away from your septic tank.

All gutters and drainpipes should be directed away from your Septic Tank and Drain Fields. By simply directing all access runoff away from your system, you are allowing the septic to treat the waste and greywater it was designed to treat efficiently. In case you permit this runoff to get in the system, your septic could become hydronically full, allowing the drainfield to be oversaturated and never do it's job effectively.

Ensure all entry lids and ports are covered tight.

Frequently, water can pass through improperly sealed lids and ports and cause troubles in your septic system. When water enters these cracks and crevaces it can hydrolically overload your septic system and make the drainfield to become oversaturated. This really is more of an issue with pressure type systems. It causes pumps to operate continuously, overworking the pump and throwing away energy and money.

Don't flush any kind of items aside from septage or bathroom tissues.

By using your toilet as a trash container you're adding undesirable items, some that will certainly not decay or chock inlets/outlets, and will need continuous pumping of the septic tank. Minimize the use of toilet bowl and drain cleaners because they are dangerous to the friendly bacteria which assisted in the decomposition of the solids in the septic tank. Avoid the use of a sink disposal unit if you're on a septic system. While those units grind up waste foods, the majority of septic systems are not created or capable of coping with this kind of undigested solids.

Have your Septic System examined regularly.

The State of Washington currently demands all homeowners to have their Septic System examined annually for every type of systems, aside from Gravity feed systems, which require to be checked every 3 years. By having your system checked out regularly you'll be able to identify and fix issues early before they turn into problems.

Following these tips and Maintenance methods your Septic System should last for many years to come!
