Termites are in existence since a long time. From ages, they have been our reason of worry when we it comes to caring our wallpaper, wooden products, fabric made from plants and plastics. Why are they reason of our worry? The simple answer is that all the above mentioned products serve as the main diet of the termites. There are many types of termites such as, Dry wood Termites, Subterranean Termites, Formosan Termites and Damp wood Termites.

Many countries have to bear huge economic damage each year just because of termites. Their ability to eat the wooden products has been the cause of major damage. Hence, Termite Protection has become very essential.

One of the most popular anti-termite treatments is Termidor. It is used in areas where the termite problem is significant. It is considered to be a long-term treatment. It is very reliable but dangerous too as it contains toxic agents. It is very important to do a full research on this anti-termite treatment before you start using it.

Advantages of Termidor

Termidor is highly efficient and effective. It eliminates the problem quickly. Other advantages of using termidor are:

- Termidor gets unnoticed by the termites. They walk through it without knowing what it is.

- It is very effective. Within a few weeks after using termidor, you will not notice any termite activity. It eliminates termites completely.

- It is environmental-friendly and has no detectable smell

- Its toxicity to humans is very low and hence, it has been approved for domestic use.

- It reduces re-infestations by eliminating the termite colony.

Considerations While using termidor

Termidor contains a pesticide called fipronil which has detrimental effects on the French honeybee industry and the Louisiana crayfish industry. Hence, it is banned in many countries. Also, termidor has the tendency to enter into local ground water and stays in the soil for long periods. It diminishes the fertility of the soil.

Time Frame

If we go by label instructions and according to the Twrmidor Company, Termidor eliminates termites within three months of treatment. Termites that face strong concentrations of this pesticide die within few hours. As far as termite colony is concerned, the time to eliminate the entire colony depends on the distance of the colony from the treated structure and the size of the colony.

Anti-termite protection is very important to have a safe and clean environment at home or at any place. Your home should be free from insects, pests and termites. You must use pest control methods at home, school and industry.
