Contrasting Home Window Types Based on Intended Rooms by Shania Fargo

Article published on February 8th 2012 | Home Improvement

Your home can have mixed types of windows which might not be practical and helpful. Otherwise, you will have to adjust some of your home's structural components to give way to both large and small types. The position of your doors, walkways, porch, and interior furniture may also be compromised. It is also doubtful that such design will improve your home's visual appeal. You need to choose one type of window per room. That way, the architectural requirements of your home will be met precisely.

Casement windows are perfect for bedrooms and study rooms. With hinged sashes that swing in or out, you can easily open them to allow breeze to freshen up your room. Their size is bearable and sufficient to allow sunlight to brighten up your room. You can actually place your study or work table right beside the casement window. This type of window cannot fit other rooms that require smaller or frequently closed up windows. For example, basement windows must always be closed to prevent leak or infestation.

Double-hung windows are also good for bedrooms but are more preferable for rooms in upper levels. This type of window is often found in apartment buildings that have 2 or more storeys. The main purpose is to keep safety for children who might mistakenly climb up the window and fall. Window experts in highly industrialized states like Michigan prefer double hung window because of a freely moving upper sash that can be lowered to allow breeze to enter while the reachable lower sash keeps the lower region closed and safe.

In places like garage and storage rooms, awning window is the best to install. It is form of casement window that opens outward or inward through the hinge along the top instead of along the side. It is basically designed for rooms that need regular airflow through constantly open window even during rainy days. It goes perfectly with vinyl siding Michigan homebuilders prefer to traditional walls.

For sides of the house that are better shut due to various factors like potential infestation or frequent soiling, fixed windows is the most preferable. This type is designed only to provide lighting and not ventilation. Homeowners who have found frequent infestation and soiling problem can call for a window replacement Michigan service to immediately replace the existing window with a fixed one.

Safety is also a concern that may cause you to decide to consider window replacement Michigan has to offer. If the windows at your home's upper floor seem vulnerable to intrusion, replacing with bay window is the best thing to do. It has features that make intrusion almost impossible.
