Controlling the algae the enzymatic cleansers way by Akon Martin

Article published on March 12th 2012 | Home Improvement

The algae form an important part of the aquatic and overall ecosystem. But they also create disturbances within the ecosystem where they thrive and this is what calls for the algae control measures. Most of the time, the natural methods are sufficient to control the algae growth. But there are times when the natural methods fall short of restricting the algae growth effectively. And that is where the enzymatic cleansers come into picture. Chemicals!!! Yes, but these are thoroughly tested to be bio-degradable and safe for aquatic life. The chemicals can help in checking the re-growth of the green waters or more appropriately green algae. They conserve the nutrients and oxygen for the use of aquatic species other than algae. And this makes them popular.

Where the natural methods take time to bring out results, the enzymatic cleanser works almost instantly and delivers quick and satisfying results. The biggest advantage is that they do not destroy the other aquatic and biotic systems while restricting the algae growth. This can be used as easily for lakes as for ponds as for pools. Pond algae control has to be carried out with great caution and with great patience and it has been observed that even after taking great pains, the algae growth returns. This is where the enzymatic and biodegradable chemical solutions have proved to be the best alternative. These solutions are mild and target only the algae and once the solution has performed the action, it decomposes and thus has been rendered safe for the overall environment. With minimal damage to the ecosystem, they help us retain the balance in the nature. So, it has of late become a best buy in the pond care products. These are not just effective in ponds and other outdoor homes of the algae but these can be used in the more indoor pools and other water bodies that are prone to the growth of algae.

The enzymatic algae control pond methods have been heralded with a positive attitude since they do more good than harm, even though they are chemicals. This has opened vast options for maintaining ponds and lakes and preserving rich biodiversity of the areas that are being sacrificed to the algae growth every year. Thus, the chemical methods have found a winner amongst themselves. And their success lies in being compatible with the nature and giving it a fresh lease of biodiversity.

Whoever said that chemicals are bad for the environment had not been born in the times of these eco-friendly enzymes that retain a healthy and delicate balance between the essentials and non-essentials of the nature! The trick lies in using them wisely, in recommended proportion and in recommended manner. Or else the results might just prove contrary. Also not all enzymes work for all places and water bodies. So it is advised to get and expert consultation before picking up a bottle of enzyme-based cleansers from the supermarket. If the nature could distribute rewards, these cleanser solutions would be a proud recipient. For the nature deserves care and they happen to deliver it, customized to the last drop.
