Article published on March 9th 2012 | Home Improvement

On the walls and floors of extravagant Roman houses, many of such tiles can be seen. With the passing of time, new tile colors, shapes, and designs have evolved, but the art of tile installation has remained the same.

Mosaic tiles are fairly new in comparison to floor tiles. As opposed to regular floor tiles, mosaic tiles are generally installed on kitchen counters and bathroom walls. If you are preparing to install mosaic tiles on your own, it is best to know that there is a distinction between mosaic tile installation and regular tile installation. Mosaic tiles are not installed by piece due to their size.

When you do this, the tiles can glide down or be misplaced while you are waiting for the glue to dry. Listed here are the proper steps in fitting mosaic tiles.

Get Ready. Before you set a single mosaic tile, you should first connect the little tiles to a lightweight sheet of mosaic tile mesh so that you can glue the mosaics onto a wall or surface in one cluster or sheet. This will allow you to work on the detail of the style ahead of time. Or else, it is going to be really tricky or entirely impossible when you stick the tiles gradually. Next, make a batch of thinset mortar. This mortar will serve as the glue that will affix the mosaic tiles to the wall or surface.

Set up. Once you have cleaned the surface or wall, utilize the thinset mortar and distribute it evenly using a trowel. Essentially, the mortar thickness ought to suit the width of your tiles. Following this, push the mesh mosaic sheet of tiles onto the mortar using the palm of your hand, applying consistent pressure on the whole sheet. Many individuals have a tendency to use rubber mallets to hammer the tiles in place, but thereâ€™s a high risk that the force could disengage some tiles and make the surface uneven. Once you have pushed all of the tiles in position, allow the mortar to set overnight. It's a good thing to leave the sheet in position while you wait for the mortar to set.

Finish. As soon as the needed time for setting has passed, you may then openly eliminate the mosaic mesh. Be sure to eliminate any glues left on the tile surface. After, apply grout to the spaces between the tiles and let it dry for approximately twenty to thirty minutes to achieve pleasing results.
