# Indicators that Say Asphalt Shingle Roofs Have to be Replaced by Brendan Gertner

Article published on February 24th 2012 | Home Improvement

This reveals that it is not just a plain coincidence why more people choose asphalt single roofing. Since asphalt shingles can be applied easily, economical, heavy duty, and pleasing, it is not alarming that they enjoy the biggest share in the industry. Several innovations have made this kind of roofing as one of the most durable forms of roofing available.

As early as the 1920s, asphalt shingles have been used widely in residential roofing. The mix of asbestos fibers and Portland cement developed a shingle that was durable and fire-resistant. Asphalt shingles were said to endure up to thirty years once properly installed and maintained. Their life span highly relies on their exposure to weather conditions like sunlight, rain, and snow.

There are two kind of asphalt shingles, namely: "organic" and "fiberglass." Organic shingles are generally created from paper with an asphalt coating making it waterproof. Fiberglass shingles, made from a type of resin coating, can regulate the temperature of a home and offer a more outstanding protection from fire.

Early Signs of Asphalt Replacements. Asphalt shingles require upkeep to work ideally. One way to do this is to look for early indications of deterioration. An example is thermal cracking, caused by the diminishing fiberglass in the shingles. The fiberglass bond that helps avoid uplifting that may be too sturdy; thus, not permitting contraction of expansion of air inside the roof. This is not a common type of roofing damage but your roofing Burnaby residents rely on can help watch out for such damage.

Aside from thermal cracking, curling is another common sign of damage. Curling takes place when the roof's shingles curl up on one side. A curling or cupping roof says the shingles are becoming very fragile and that specialists supplying roofing New Westminster has to offer has to replace them quickly to reduce cases of leaky roofs.

Cupping is another sign. Here, the shingles develop a low pit in the middle of the roof and lifts its edges and shape them like a 'U'. This is accomplished by the asphalt's old age and weak attachment to the roof base. If your roof has this, you should call a specialist for roofing in Surrey to assess it. Never step on cupped roofs as they may crack open and cause you to slip or topple.
