Know how to design the best access control system for your home or office by Sridhar Raj

Article published on August 23rd 2012 | Home Improvement

A secured home or office can ensure peace of mind for the owner. With advanced technique, a range of security options have come up at affordable prices. The selection needs to be done based on security needs.

Access control system can be defined as a kind of electronic security solution which is installed to manage flow of people into, around and out of buildings. Such a system serves three major functions. It can monitor whereabouts of individuals within a building. It can also control locations where individuals are able to gain access. Besides, the system has options to manage individual user permissions thus ensuring that access is granted to the right individual to proper locations at the right time.

Till few years back, access control system installation was requested by companies only. However, with change in lifestyles, modern households are also opting for full proof security options. For office or factory securities, advanced systems which are powerful, computerized and adaptable can be of great help. It all depends on the security need of the company. There are many who opt for systems which can guide visitors and staffs according to spatial and time-controlled access authorizations. Then there is the option of biometric fingerprint reader which allows accurate recognition of the person based on his/her unique physical characteristic. Many companies also opt for door interface with integrated authorization management system. Whatever system you opt for, make sure to verify that it can be set up quickly and individually for each entrance. There are service providers which have gained proficiency in designing the office or building security by installing latest techniques.

When it comes to home security, you need to select the system which is simple to operate and can be controlled from within the four walls of the room. Since such systems are usually operated by family members hence it is very important that they feel comfortable with its operation. A standalone system with a master transponder can offer perfect safety for each individual door. There is no need to connect it with a computer or network. For a bigger setup, it is possible to create a network allowing access rights to a certain number of doors or access points.

Before opting for any specific access control system, it is very important to analyze your specific requirements, e.g. if the system is needed for your office you have to decide whether the system is to be installed for the main entrance or for all doors. Then there are many other factors which should be taken into consideration. Since it is not possible for the buyer to know about different security options and related techniques, hence a discussion with the service provider is very important. If needed, the company will carry out a personal inspection of the premise and then suggest the right solution for you. Make sure to ask in details about the specific system. The main advantage of entrusting a reputed service provider is that you can have a compact package with options like emergency exit, electronic locking, biometric system, interfaces, video technology, and many more. You can select all or opt for only those which are absolutely necessary for your home/office setup.
