Article published on May 28th 2012 | Home Improvement

The concern and advancement of septic-tank systems is engulfed with plenty of misconceptions which are the same around the world. Lots of people just seem to imagine that the septic tanks can just go on for a long time without them being evacuated.

It is only common knowledge that the longer the septic-tanks remain without them being handled, the harder the work will be because of the hardened sludge which had developed through the years. This is no little issue, and it might even need someone to get in and dig it up eventually. Typically, the excellent care of these tanks require that they're maintained yearly so they can be emptied and cleaned well. It's the best way they can stay in good working condition.

Appropriate maintenance of the tanks system is necessary so that you can save costs over time and save you the headache of excessive work when the tank fills up or gets clogged.

Another wrong idea is that the home owner isn't responsible if the septic tank flows over. It should be clearly stated here that the single obligation for good maintenance of the sewer tank lies directly on the shoulders of the house owner.

The house owner is still responsible in every concerns associated with septic-tanks and that can consist of blockage, overflow, and environmental effect and these will never be handled by the local authorities. The only time you will find the authorities enters into this kind of problems will be once the property owner enables the septic tank to overflow to the extent of leading to an environmental problem.

It's also a misconception to consider reason that your tank fully treats the sewage. Part of the sewer treatment procedure occurs when the fluid waste gets into the soil by means of what is known as soak-away. It decreases the bacteria in the tank, affluent and sets apart the solid waste that will also continue to build up in the tank until it is eliminated.

Finally, it should also be realized that it is not everything that may be put into the septic tank. You will find problems of harsh detergents plus different chemicals being place liberally into the septic tank. It has been tested that such things as fats, other oils and solid things shouldn't be permitted to get into it because they can affect the smooth running of a septic-tank. Each one of these points needs to be observed to the letter, not unless you wish to be given regular visits by a company. If these suggestions are ignored, the result is going to be that general maintenance for unblocking or fixes can be very expensive.
