Strong and Beautiful Roofing Systems for Woodstock, Georgia by Norbert Floth

Article published on March 19th 2012 | Home Improvement

Bordered by Florida to the south and South Carolina and the Atlantic Ocean to the northeast and southeast, Georgia commonly experiences a turbulent, humid subtropical climate. Humid subtropical climates are characterized by a generally mild temperature, with hot and humid summers, and winters with little or no snow. Winter temperatures tend to stay above freezing, but other climate hazards like cyclones and tornados can occur.

Like in any other place with the same climate, Georgian summers are hot and humid except in higher altitudes. Georgian winters have less snow compared to other areas in the region. However, freezing rain is a major concern that calls for strong, well-ventilated roofs. Freezing rain starts out as ordinary rain until the droplets freeze upon impact on a solid surface. Freezing rain can injure the skin of people who come in contact with it, can cause significant damage to houses, and make roads dangerously slippery.

Tornados and cyclones are also normal for the area. In fact, Georgia is one of the States that most frequently experience tornadoes and the regular bombardment of hail. In contrast, although cyclones also affect Georgia, the state rarely suffers a direct hit.

In light of this, the roofing in Georgian homes needs to be strong and resistant to great damage. Wood and clay tile roofing materials continue to be used in Georgia because technological advances have made these materials strong enough to withstand trauma and moisture. However, these still require maintenance more often than other stronger materials.

Many roofing Woodstock GA contractors recommend asphalt roofing. These hard shingles are only called asphalt shingles because of the asphalt covering. However, the bulk of it is really made of fiberglass, an aggregate of plastic and glass. Fiberglass itself is sturdy and resistant to water, fire, and trauma. With asphalt to further contribute to moisture-resistance and colored ceramic granules for strength and beauty, you have an ideal roof for a home in Georgia.

If you would rather use a cheaper material, metal roofing is ideal. In any part of the world, metal roofing can be made of copper, aluminum, or steel. However, Georgians should use slate, tile, or asphalt shingles. Steel roofs may also be covered with asphalt and ceramic granules. Woodstock roofing contractors are confident that these metal roofs are a great protection against rain, snow, ice, and hail.

Metal roofs require periodic repainting from Woodstock painting contractors once the factory finish begins to fade. Periodic repainting prevents corrosion from occurring. On the other hand, slate roofs do not need to be repainted. Slate is a beautiful bluish stone that is cut into plates and used as roofing. These can last from eighty to one hundred years.
