Tankless water heaters are considered by many to be an efficient, consistent alternative to standard tank water heaters. Plumbing services in Houston have been bombarded with requests for information about tankless water heaters and the different applications they can be used for. Plumbers in Houston are also scrambling to become dealers for the different brands of tankless water heaters available on the market so that they can start installing them in homes and businesses in Houston.

Plumbers in Houston openly tout the many advantages of tankless water heaters. Key advantages of tankless water heaters are their space saving design, reduced energy cost, and consistent, nearly constant supply of hot water. Plumbing contractors can install a tankless water heater nearly anywhere, and users will see the other advantages very quickly. In addition, plumbers in Houston can install tankless water heaters in both residential and commercial structures, so they are suitable for nearly any hot water application.

The simple, compact design of tankless water heaters ensures that plumbers in Houstonwill be able to fit a tankless water heater into nearly any space. Tankless water heaters do not need to store water, so they do not need to waste the space storing hot water like standard tank hot water heaters normally do. Plumbing services in Houston can quickly install tankless water heaters since much of the existing plumbing can be used in the installation for the tankless water heater. The quick installations let users start to see the advantages quickly, and one of the first they see is an attractive, compact water heater in the space of their large, bulky tank. Once installed, plumbing contractors will only need to rarely check on the tankless water heater, and they can last up to 20 years, or twice as long as many standard tank water heaters.

One of the biggest reasons customers switch to tankless water heaters is the energy savings. While natural gas is relatively inexpensive, like other energy costs, it is sure to increase as time goes on. Plumbers in Houston expect up to a 50% energy reduction with tankless water heaters when the switch is made from an electric tank water heater to a tankless water heater. While the savings are reduced, plumbing contractors say even a 20% savings in electricity could be achieved when switching from a gas tank water heater to a tankless water heater.

Another tangible advantage of tankless water heaters is the almost constant and consistent supply of hot water. Tankless water heaters can detect when a user needs hot water and immediately starts to heat the water passing through it. Plumbing services in Houston say the only limit to a supply of hot water through a tankless water heater is the capacity of the plumbing itself. This means that as long as the water does not run out, the hot water will not run out. The days of hot showers turning cold are over if a plumbing contractor installs a tankless water heater.
