The Cost and Performance of Common Siding Materials by Adam

Article published on April 18th 2012 | Home Improvement

It is extremely crucial for a homeowner to think of techniques to prolong the life and appearance of his home. One effective way is to install siding in addition to the existing wall. Siding is a type of cladding that improves the permeation-resistance and the resale value of a house.

Throughout the decades, siding has evolved into a heap of various materials. Wood, metal, bricks, and vinyl have become common siding materials for residential buildings. Some commercial buildings are also seen clad with siding to improve their architectural value. When assessing the performance of a siding material, the three aspects to be evaluated are its efficiency, durability and resistance to damage.

The efficiency of a siding is measured by the benefits that could be reaped from it. One factor to consider when measuring efficiency would be its suitability to your local areaâ€™s weather conditions. Wood siding, for example, is more efficient than tile siding in humid and hot locations because tiles absorb and trap heat, causing your house to get hotter faster. Meanwhile, vinyl and metal are excellent insulators during cold season but are prized almost as cheap as other manufactured siding products.

Metal siding is the most durable of all siding materials, but a well-maintained vinyl siding can compete very well. Both vinyl and metal have high resistance to damage and do not easily get dented or punctured, especially when properly coated. Proper maintenance can prolong the life of siding to more than 25 years before replacement siding must be installed.

The cost of siding can be broken down into two partsâ€“the siding material and the installation. The material cost depends on the model, availability, market, and season. Experts in Arlington siding and other prominent cities recommend vinyl siding as it costs less than the other types. Metal is also relatively cheap while wood and tile siding are more expensive.

The cost of installation will vary depending on the scope of work to be done. Some siding installations require dismantling of existing siding Arlington builders will tell you that this will require more work and of course, more cash. Should you decide to skip the hassle of paying an additional dismantling fee, you can opt to go for metal siding. It can be installed directly on an existing siding without affecting its adherence and durability.

If you would like to read more about the differences between commercially-available siding materials, you can check out servicemagic.com. This website provides detailed information about the cost and performance of siding materials. It also provides interesting information about other exterior structural components, such as Arlington roofing and walling.
