The Rising Need for Water Conservation by EugeneYeng

Article published on January 10th 2012 | Home Improvement

As the global population continues to boom, it is important that we understand the responsibilities that we have for the future of our planet and how our current practices cannot be maintained if we wish to have clean water in the future. In industrialized nations across the globe, governments are touting water shortages that may seem to be irreversible. Desalinization still remains a horribly inefficient method of creating clean water, which is why we must make the most of the naturally occurring water we currently have access to. Rain water tanks remain one of the single, greatest weapons we have in the battle against water depletion, and because they can significantly decrease the amount of water we draw from the drinking water supply each day, many countries are encouraging residents to implement their own, on-site water conservation systems.

Water Use by the Numbers

Did you know that almost half of the water we use each day isnâ€™t used for personal consumption? Obviously, we use it, but instead, we are talking about drinking water. This means that nearly 50% of our drinking water supply is being completely wasted. From washing cars to watering plants, there are several different common activities that cause a drain on our water supply. Australian rain water tanks are changing the way many view drinking water, and the implementation of such strategies is already making a difference in many parts of the world.

Simple Changes

All that is necessary, should these statistics concern you, is implementing your own water tank. When you install and utilize rainwater tanks, you can capture rainfall, store it without taking up valuable space, and use it for the 50% of daily uses that we mentioned above. And, when you do the math, it should become apparent that this can also save you plenty of money over the duration of your rainwater tank usage!

Reusing Household Water

With the right filtration system, many homes can reuse much of the water that is utilized throughout the day. Anytime you shower, do laundry, or wash dishes, the water that is used can be filtered and used for other, similar purposes. Of course, drinking grey water is never encouraged, but why not use this water to water the garden or clean your car? These small changes can make a huge difference down the road for both your wallet and the planet as a whole.

Your Options

Whether you elect to use above ground slimline tanks or underground concrete tanks, you can put your system in a place that is convenient for you. Many owners find it convenient to have constant access to their rainwater cache, which is why the above ground models draw so much attention. However, if space is at a premium, the underground models can place the rain water tanks out of sight while still delivering the same bevy of uses.

Water conservation is going to be a common theme for the coming generation, and Australian residents are taking note of the options they have to help reduce the amount of drinking water used on a daily basis. Whether you have the need for several underground tanks or a single, above ground water tank, there is a design that will cater directly to your needs. Pump systems, filtration devices, and storage management resources abound, so why not take a moment to ask yourself

how much water you could save with a few minutes of research? Give your children the gift of a cleaner planet by using the technology that is readily available! Australian rain water tanks are changing the way we view water consumption.
