Wall Cladding â€“ Power to You By Ben Bradshaw

Article published on December 13th 2011 | Home Improvement

Cladding refers to placing something over and on the other. Cladding is used in a wide variety of contexts, and when used as the phrase Wall Cladding, it refers to the construction industry. Wall cladding is the process of adding on any material to the wall, with the purpose of insulating the building, weather proofing to protect from adverse external conditions, or in general, of protection of the building. Wall cladding is different from external cladding, in that wall cladding could be done both on the outside as well as on the inside, while external cladding refers to the cladding done on to the external walls of the building alone. The purpose with which wall cladding is used definitely depends on what the unique situations and circumstances of the property are.

There are a wide range of materials that are used for wall cladding, and each of the materials has its own advantages and disadvantages, even as they vary with the purpose with which wall cladding is done. And as you could expect, the costs involved with the various materials used would also vary. Hence, budget is also an important consideration when choosing among the various options in wall cladding. The material used would be wood or stone or composite, with the overall purpose being providing protection to the surface. Even among wood, there are different kinds of wood that go into the cladding, and the type of wood used determines the kind of expenses that you could expect to incur. Pine, oak or cedar could all be used as options in wood for wall cladding.

There is another option to wall cladding, which would be using the uPVC option. This is a plastic composite which would be the perfect choice for most extreme weathers, if you thought wood was turning out to be an expensive option. Not only is the plastic composite option a good one for extreme weathers and is less expensive, but is also something to reckon with, when it comes to the styles and designs in which it is available. This is a completely processed manufactured option that could be purchased off the shelf and fit on to the walls, to provide the perfect finish that you could have asked for. With water proofing as well as thermal properties, what you have on hand is just the right kind of wall cladding that would serve your purpose and add to the interiors or the exteriors with equal aplomb.
