What to Look for in a Pest Control Professional

by Temple Young

Article published on March 22nd 2012 | Home Improvement

When you encounter pests or mold in your home or work place, it is best to find a pest control professional. Ignoring the problem or using ineffective measures against it will delay the eradication and cost more money in the long term. Toxic mold cannot be destroyed by household disinfectants, mildew resistant paint, a coat of paint, or just a superficial scraping. Similarly, pests such as bed bugs and cockroaches need to be eradicated by a professional. When looking for a pest control professional in Connecticut you need to ask for:

A free quote (if possible - gas prices are high)

Certification (from the EPA and others)

What kind of technology they use

References

Structural Pasteurization

Many expert pest control professionals in New Jersey are now aware of the advantages of structural pasteurization over chemical fumigation. This eco-friendly method causes less damage to the roof of the building, enables the occupants to use the building sooner, and causes minimal damage to things stored in the building. Only living beings - people, pets, and plants need to be moved out.

What is Structural Pasteurization?

If your pest control provider in New York offers structural pasteurization, you need to understand how it works. This process works by the pumping of dry heat into a specific area to destroy mold and pests. Most pests and mold cannot survive at very high temperatures, especially if there is no moisture. During structural pasteurization, the professionals will pump in dry air into the building. They will use fans to disperse the air evenly. The temperature of the air and the duration of the procedure depend on the pests being eradicated. Once this is over, the dead pests and mold will be removed, and the occupants can move back in with their plants and pets and reclaim what is rightfully theirs.

Other Methods of Mold Remediation

While structural pasteurization is effective in removing mold, sometimes the mold remediation provider in Massachusetts, or surrounding areas, will suggest other methods. This depends on the extent to which the mold has spread. Typically, the visible mold will be sucked up using a special vacuum cleaner. Then, specially formulated chemicals will be used to treat the surface on which the mold was present. This will ensure that mold does not grow back in the area.

Heating it Up

When structural pasteurization is used for mold remediation in Philadelphia, the chances of mold growing back are lower. This is because the heat kills not only the mold but the spores in the air. The heat can penetrate even hard to see areas such as dry wall cavities to ensure that your home is totally free of mold or mold spores. This ensures that your home will be free of mold as long as you can keep it dry.

A Solution

When assessing various pest control contractors ask for a team that is willing to provide a free quote. They should be certified to use the different methods available to control pests. Moreover, an expert pest control contractor will be able to evaluate your individual problem and recommend a solution that suits your needs.
