Article published on May 3rd 2012 | Home Improvement

There are a few things that can ever be overdone especially if your aim is to reduce utility bills. This is why even after installing the most energy-efficient windows on your Michigan home, there are still ways to better insulate your house. By adding treatments to the newly-installed windows, you can make sure that your energy bills are as low as they could possibly be.

Energy-efficient windows that Michigan homes use typically have two to three panes. The multiple panes in the window act as a thicker barrier between the inside of the home and the outside, which makes it harder for thermal energy to transfer between the two sides. The spaces between the panes are usually filled with gases to further ensure that there is no heat that passes through the windows. By adding window treatments to these already-efficient windows, you can reduce heat gain in the summer and heat loss during the winter.

Window Film

Window films bought from Kalamazoo roofing contractors and home depots are designed to reflect harmful UV rays away from the home. These can be installed by gently applying the film to the window pane with a squeegee. Come winter, you can carefully peel off the film and allow more sunlight to enter and warm the home.

Blinds

Blinds are some of the most inexpensive yet effective window treatments that a Michigan homeowner can use. All you have to do is close them during summer months to deflect the sun, and open them during winter to let the sunâ€™s warmth in. Kalamazoo window experts say that your homeâ€™s heat gain can be lowered by around 45% when you close your blinds during the summer.

Quilted Roller Shades

Quilted roller shades that can be used to cover replacement windows Michigan homeowners have are really thick pieces of material. These offer several layers of insulation that can effectively block heat, sunlight, or drafts from entering the home. The thick layers can easily darken the room, though.

Thermal Window Coverings

A thermal window covering for replacement windows Michigan homes have are basically thick curtains. On the side facing the window, it is covered with a reflective material that bounces sunlight away from the house. This prevents sunlight from heating up the home.

If your windows are not as energy efficient as you want them to be, or if you need advice about window treatments, donâ€™t hesitate to call roofing companies in Michigan that specialize in the installation and maintenance of energy-efficient windows.
