Private Cloud Solutions, GNAX Can Be the Answer

by John W. White

Article published on May 4th 2012 | Insurance

Small businesses can take full advantage of IT services like private cloud solutions and the virtual private cloud as is needed. This is often pursued as an effort to make their business operate more efficiently and effectively. Since small businesses sometimes cannot afford a dedicated IT department, cloud computing is ideal from a practical and economic standpoint.

Being in the cloud allows small businesses to interact with each other, regardless of their physical locations. Teams can share files, emails and other information within a virtual platform that updates itself on a continuous basis. Working in "real time" gives businesses the opportunity to see exact information as it is and how it can affect their business.

Since the virtual private cloud exists within an existing cloud, it's wise to secure managed cloud hosting from colocation data center providers since data can be either shared or made public, such as the Intercloud. The virtual cloud makes data management easier and adheres to multiple departments within the business. Through the virtual cloud portal, your business enjoys the speed of delivery and also has the ability to create customized networks.

In lieu of a networking center for small business, they may choose to use a colocation center for a cost reduction on IT expenses. Our team at http://www.gnax.net offers the colocation services to our clients. Our service is a retail rental provider for equipment space and bandwidth and also provides space, power and cooling for customers. Essentially, the customers are connected to a large resource of telecommunications and network service providers, but with only a fraction of the cost that it would be normally for one standalone business.
