Improve Website security with VeriSign Secure Site certificates by Daren Bresnen

Article published on April 23rd 2012 | Internet

In today's world of rapidly evolving technology, many people use electronic media to buy and sell goods and services over the Internet. Thus, e-commerce shows itself as an important component of business strategy. For directions, in any way deal in which the parties communicate digitally, rather than direct physical contact, known as e-commerce. Simply put, it's an act of assistance to the Internet or other systems of interaction. The development of online shopping, telephone verification, maps, intelligence, detailed warehousing, business resource planning (ERP), systems and communities Wide Web (Internet) are just a few of the new elements of e-business.

Nevertheless, thousands of people face the problem of security for the exchange of confidential information over the Internet. That is why they will think twice and leave the sites that do not make their security protocols can easily and safely clear. If your site sells products to the public, it is important to develop a trusting relationship with your users by providing a website with SSL-certificate.

Secure Site with EV SSL certificate provides no less than 40-bit and 256-bit encryption, and more than 99% browser recognition. It also includes a $ 100,000 warranty and the VeriSign Secured Seal.

VeriSign Trust Seal works very well, because the increases in anxiety fake websites, malware and phishing, which made the customers / users are hesitant to do business on the Internet. Sites around the legal form and safety, but cannot be, at least, you cannot trust the place of 100%. VeriSign Trust Seal is the most recognizable brand and makes your site a trusted online. Print improves user satisfaction on the site.

Included for free with this and all products of two services VeriSign VeriSign: VeriSign Seal-in-search drive search engine visitors to your web site, communicating with your high level of safety and trust, and VeriSign malware scanner automatically scans your web site every day, protecting it from the blacklist. Harmful use is growing every day, and the blacklisting of browsers and search engines has become a game-changer on the web market.

Every time you open a secure site for transaction processing, web address bar turns from white to green to represent that the website uses EV SSL certificates. The official name of the organization of the site owner is shown on the certificate information. Normal switches to advanced HTTP-HTTPS, indicating that the link between a web browser and the server using SSL. Padlock indicates that the live connection is now protected from viruses and hackers. A green bar increases a sense of fairness and trust in the organization, and EV green bar is becoming more widely used every day.
