Article published on March 28th 2012 | Internet

Internet has made revolutionary changes in every aspects of life and website development is not an exception. Website is a strong medium on the Internet to make your presence online in an effective way whether you have to promote your business products or services or you have to interchange your views on any topics with the other peoples. There are various kinds of website such as individual website or blog, ecommerce website, forums website, community or networking website, news portal along with many others. Every website has some specific requirements and they are built on the basis of those requirements.

If you are going to develop your website for the first time, you should consider your financial budget that you want to expense for your website development work. Costing is one of the most important factors in anything and website development is not an exception. There are many programming languages that are widely used for building websites. Some of the most popular programming languages are PHP, ASP, ASP.Net, Java etc. Along with these programming languages, there are various CMSs (Content Management Systems) which are used to build websites. Some popular CMSs are WordPress, Joomla, Drupal, osCommerce, Magento, DNN (Dot Net Nuke) along with many others.

If you have to develop a small business website within a limited budget, PHP programming language would be best suited. Being an open source programming language, you need not pay any kinds of license fee if you develop your website using PHP programming languages. Moreover, PHP based websites are hosted on Apache server which costing are less than the other types of server. This saves your hard earned money. There are limitations of PHP but this is best suited for small businessmen who have limited budget to build their website. If you want to develop a large database driven ecommerce website, you should choose ASP, ASP.Net or Java programming language as these programming language provide many features and functionalities that are required for the website according to their business as well as marketing needs and requirements.

You can also use CMSs (Content Management Systems) for developing your website by yourself. It means that you need not to be hired separate web developer team to accomplish your website development or maintenance work. You can develop as well as maintain your sites using CMSs because they have some inbuilt functionalities by which any one can develop their site without having expertise in any programming languages. This results in reducing the costing of your site.
