Leased Line: Providing business connectivity by Peter D

Article published on November 28th 2011 | Internet

In the last few years technology has become such an integral part of a business that without it businesses find it really difficult to survive. Businesses are always on the lookout for some technology that can yield best results. They seek services that are not only cost efficient, but also that fulfill their requirements to the fullest. Communication is one such important factor that determines the success of business to a great extent.

Internet is one such tool that offers an instant and accessible set of resources to organizations. A number of Internet Service Providers have started offering Leased Line connections to users. But what exactly is this service and how it actually functions is what we will be discussing today. Leased Lines are referred to fibre optic cables that are used by businesses to link their branches or offices. These are especially designed to offer its users with a reliable level of connectivity at all times. It is a dedicated connection that provides a user with a highly secure and private connection that is superior to any other broadband plan available in the market. This connection offers enhanced communication between colleagues of a company and their customers. The feature that makes this connection stand out is that it can also be used by businesses for internet services. This service is considered most suitable for companies that have high internet usage and need continuous communication among its branches.

This service comes along with a number of benefits. As this is a constant service, businesses tend to benefit immensely because of its nature. Once a user installs this service, he is required to pay either a monthly or an annual rent for the connection, depending upon the agreement between the service provider and the end user.

Almost all businesses have started using this connection for better internet accessibility. These private data lines offer its user with a swifter and congestion-free data transfer. As it is a constant service, the data sent through this service travels along dedicated safe medium, lessening the blockages that come out in a normal shared network. Several BPOâ€™s and IT Companies have started to install Leased Lines in Delhi. This dedicated connection usually comes in a various sizes, ranging from 2Mbit/s up to 10Gbit/s plus. The superior speeds are delivered through a fibre-optic network, while the inferior speeds are delivered via a fibre or over a mix of fibre and copper (DSL) network.
