Article published on March 29th 2012 | Internet

Ever been haunted by the risk of hackers keeping an eye on your data and checking each email you send and each conversation you have with someone over the internet! Does not that idea send chills down your spine? Some of the deepest secrets you have might be revealed to this hacker and you might even be traced by him to blackmail you over that. If you are a human, of any occupation or age, you will most likely have this fear. These kind of risks are eradicated by personal VPN services.

Personal VPN - Virtual Private Network, is a like a secure bridge between the user and the company that provides a safe server. This enables a very secure connection that gives a lot of benefits to the user that is going for that Personal VPN.

It's an age where hacking has become widespread; Even people who no nothing about it can easily download hacking softwares from the internet and step into the hacking world quickly and easily. These hackers gain access to your information and thus promote data theft. They can even literally keep an eye over what ever you are doing on internet 24/7! So, in these types a Personal VPN has become an absolute necessity to provide protect and secure internet surfing through wireless shared networks, hotspots, or any other internet access whose control is not in the hands of the user. Connecting through a Personal VPN turns the user's IP address into a trusted server's so it becomes very difficult for the websites he/she is visiting to detect his/her IP address and hence prevents them to collect information based on it.

It also gives the users, the access to hundreds of websites which may be restricted in their regions due to many different reasons, so if you are on of those who want to go into the restricted zones, Personal VPNs are the right choice for you as they solve this problem quite easily. A Personal VPN is not just important for a PC, in fact all the devices through which internet access is possible requires a VPN protection. Many of the companies are providing different sorts of Personal VPNs for all types of operating systems like Windows, MAC, Linux, iPhone, Android, etc.

It is true that fast Personal VPN is the one which is most reliable and efficient. Extensive and fast VPN networks gives quick protected and secure transfer of data between the safe server it provides and the user's device, which in turn gives a lower vulnerability to the hack of information from that particular device over the internet. In this age, people mostly depend on high speed internet and hence a fast VPN too becomes a necessity. Fast VPN protocols includes, OpenVPN, L2TP/IPSec, PPTP and SSH2. As increasing the speed of the VPN gives you an increasingly better protection, it also gets more expensive as the user demands a higher speed VPN. However, compromising on your security for saving a small amount of money could be mere foolery; It is smart to spend on a fast VPN rather than going for a free or a cheap VPN which is more often futile.
