Useful Tips to Choose a Unique and Secure Password by Cody

Article published on March 22nd 2012 | Internet

There is no doubt about the fact that we get to enjoy a multitude of features on the virtual world of entertainment- the Internet. Some of the most useful and time-saving online activities are Internet banking, socializing, emailing etc. However, there is one thing common among them- the usage of passwords. In the virtual world of Internet, personal information is vulnerable. These days, hackers are on the prowl looking to hack the passwords and other important details from your email and social networking site accounts. As they say â€œPrevention is better than cureâ€œ, it is always good to be on the safer side. The trick lies in creating unique passwords that canâ€™t be hacked. Scroll down and find some useful tips that will give you valuable information on how to choose a unique password and secure it.

Tips to Choose a Strong Password

Change Passwords Frequently

Password-hacking is highly possible especially when you maintain the same password for several years. You may do so because you are comfortable in remembering the same password rather than multiple passwords. You may think that your password is safe and secure but that canâ€™t be the case always. Let me illustrate this with a simple example. If you are using any of the popular Internet connections such as the one powered by Charter Deals and get any interesting mail with a catchy subject in your spam, you might have the eagerness to open the mail and click on the link given on it. When you click on the wrong link, there is always a chance that your system will get affected by virus. It is always good to change your passwords frequently so that it remains safe and secured. If you think you are forgetful in remembering your new passwords, then make a note of it as and when you change it. You can note it down on your personal diary or cell phone.

Password Length

Most of us prefer keeping shorter passwords as they are easy to remember. However, online experts suggest that ideally a password should have a minimum of eight characters. This is because; shorter passwords are easier to hack than the longer ones. Note that hackers need to use lesser permutations and combinations to hack the smaller passwords.

Combination Passwords

If you want to make your password stronger and secure, then you may muster it up with a combination of alphabets, numbers, symbols, and special characters. Most of us have the habit of keeping names of our beloved ones as our passwords. Even if you do it, next time, make sure that you mix additional special characters and numerals so that it gets difficult to be hacked. So, this is one way of protecting your online personal privacy.

Variety

Most of us make the mistake of keeping the same password for our email, net banking, and social networking site accounts. However, if the hacker is smart enough, all he needs to do is hack any of your account passwords and access all your personal online accounts. So, it is always good to keep different passwords for different accounts, just to be on the safer side.

Fresh Passwords

If you have forgotten your password, make sure you create an entirely new password for your online account. Donâ€™t keep any of the previous passwords used by you. Create fresh logins and get rid of the fuss. Nevertheless, since forgetting the passwords is very common among online users, it is always good to keep a record of the passwords as and when they are changed. Thus you will never have to worry about forgetting your passwords again. These are some of the steps to create and maintain safe and secured passwords. Hope you found the information useful!
