Some Important Facts About Search Engine Privacy by Terry

Article published on June 1st 2012 | Internet Business

If you are reading this article then you are probably looking for more information with regard to search engine privacy. The internet has grown significantly over the last few years and it is true that anything you do online could come back to haunt you at a later date. This includes everything that is under your search engine history. You may consider some of this information to be private as perhaps you were looking for private information or searching embarrassing topics, however you would be surprised about how much information a search engine can access about you.

Many people are starting to feel betrayed by the lack of search engine privacy as it does not seem right that a company should be able to access everything you have searched for and you have the right to feel queasy about what these companies may know about your own private thoughts.

One of the biggest search engine companies is Google and they are highly likely to have personal information about you. Your Google account can be used to create Gmail and Google Maps and Google are aware of your search history, what you search for, the contents of your email, where you live and who you socialize with.

However it is important to note that it is not only Google as Yahoo is also able to track your emails and search history. One way you can improve your search engine privacy is to sign in to your Google account but then search on another site that is unrelated to Google. You should try to spread out your searches on a variety of different websites because then all your information will not be in the hands of one big company.

It is a good idea to get a search engine list as this will provide you some alternatives you can use instead of Google, Yahoo and Bing. It is also important to note that the smaller search engines work equally as well and they also often protect your information better than the larger companies.

There are some things that you should not search for on any search engine. You should never search for your name or the names of other people with things that you would not want other people to know. For example, you should not search for your name matched with your social security number as if the search engine had a security breach then all this information could become available to third parties and make you vulnerable to identity theft.

You should also never type in passwords, usernames or bank account information in the search engine. Basically you need to use common sense and not search for anything that you would not want anyone else to read. However it is important to point out that your search engine privacy can never be 100% ensured so you should always take steps to protect yourself and remain vigilant against any individual who could take your information and use it against you.
