How 52-Week Lows Help Investors by Jennifer More

Article published on August 13th 2012 | Investing

Understanding the strategy and the long term benefits of low stocks can help you increase your profits. Some investors follow one strategy, which is investing in stock companies that are hitting new highs. You should be cautious enough to make wise investments, but before investing you need to consider a few things.

What do lows tell us?

A 52-week low is the time when a stock company is trading at its lowest price as compared to the last 52 weeks of the previous year. This helps investors compare the stock prices and also helps to predict the stockâ€™s growth in the future. This allows investors to check which stocks to buy.

These lows help investors to invest wisely during the companyâ€™s lowest trading prices. The number 52 has been used to let investors remain informed about the recent prices of the stock. The main idea behind 52-week lows is to present the performance of the company in the past business years and today.

These lows also act as indicators. It helps to know the past and current status of the companyâ€™s stock market to help the investor determine the recent value or trends of a stock.

How can they help us determine some of the best stocks to buy?

The success and profit of an investment is determined by the initial price invested in the stock. Looking at the list of the companies trading at their new lows can help an investor buy stocks. You can easily find cheap stocks at 52-week lows.

The 52-week ranges can help investors determine some of the best stocks to buy. They can compare the present stock price to the range. With this they can get the best idea about the stock. For instance, if the current price of the stock is less than the low, it indicates that the companyâ€™s performance is low or undervalued.

The 52-week range is helpful in providing relevant information such as predicting the direction of the stockâ€™s price and market value. It can also help investors determine the buying and selling points and stability of the stock price.

Barchart contains a list of stock companies that have recently hit new lows. The table provided for the lows includes the list of companyâ€™s stock prices. The table also has a list of 52-week highs and the 52-week range. Barchart can help investors compare the current price of a stock with the range and this will help determine the best stocks.
