Article published on February 15th 2012 | Management

It was not long tml5 appeared, but he created many waves of webmasters, developers, designers and seo professionals. Taking into account the use of html5 in the most common semantics of today's internet, it was not that satisfactory. Popularity is more between designers and developers only. The reason is that it gives greater flexibility in terms of design / development smoothness. Html5, css3, along with when it holds the potential to replace animations and effects done in flash. The use of the canvas, move, modify, gradient, etc. Has increased the scope of web design and development of the collector. Now the question is, what can all do to seo? let us discuss in detail.

Html5 has come up with some useful tags and elements that provide it users with multiple options for developing and optimizing web pages and applications. From seo point of view, the tags as header, article, section, nav and footer certain to gain importance in the near future. If you look at the descriptions of these tags and elements, you will agree that some have been developed to help search engines have a better indexing of the web. I shall here briefly explain tags. Header: seo ask anyone about the most important tag on a web page in order of their importance in seo, and get answers as h1, h2 and h3. It has not changed much in the tml5 all the title tags are the same, and in addition you can use the title as a separate html / css tags.

A title element tla 5 1 - the same is. H6 tags. The contents of the tag is considered to be the most important things you can search by product website. You can turn content into [ ]. Article: this tag should be used for text content. When you wrap the], the search engines recognize that they inside the article text. Windows 7 section: this is yet another important tag in html5 news. It signals the search engines for all the different sections of content you have on your website. Nav: it is used on the web page navigations. Simply place your navigation links under [ ] and you are sure that you are talking about all the spider web navigation links you have your own web site. Footnote: there is no need for custom classes and div ids to encode footer. Use of the mark footer makes it easier for you to search engines as well as. For the various pages of your web site, you may have a variety of footer section. If you like and can play with the design that you normally would in html4. Html5 in the coming days, it is a vital role in search engine optimization is the reason why it stands. Looking at a page written in html5, anyone with a basic knowledge of html5 can know what are the most promotional content on a website, so why not search engines? practically, html5 provides improved segmentation and the page is, of course, nothing less than a feast for the search robots.
