Article published on March 20th 2012 | Marketing

Transport business or shipping business has become very lucrative nowadays and transportation of dangerous goods often gains importance. These dangerous goods, also termed as hazardous materials (Hazmat) are transported all over the world. However there are certain laws set by the government and most of the countries follow some rules and regulations to transport dangerous good to other countries. The import and export of such goods are executed with special care as these goods are very harmful to the environment as well as to the people.

While in transit, accidents can easily take place as they are inflammable goods and these materials might harm the blameless bystanders, who are involved in transporting the goods. Hazardous classification of dangerous goods is very essential in order to induce safety. This article informs you how these dangerous goods are transported and how the process takes place. What type of goods is transported is also discussed in this article.

Types of dangerous goods

Dangerous goods are products that have a threatening effect on the people and also to property. Such items include explosive gases, explosive liquids, some toxic substances and also many radioactive materials. Harmful gases like methane and CFC are some dangerous goods, while Sulphuric acids are included in toxic acids. If these items are not handled properly, they can be fatal and can even lead to death.

How is the transportation carried out?

Special care need to be taken while transporting Hazmat. They are secured in specific containers and a track of these goods should be kept and there are some documents regarding these goods. Some countries also need some signs to label the vehicles in which these dangerous goods are transported. Proper classification is required. For example you can classify the gases as A and liquids as B and mark it on the containers. Then the transportation becomes very easy and safe.

Proper training

Before you involve in the transportation of dangerous goods, you should undergo special training. In such training, you are taught how to handle the harmful goods. Also if any accident takes place, such a training course teaches you how to respond to it and how to face the accident. IATA is a training program that gives special training to individuals who are involved in transportation of dangerous goods by air. The professionals are taught very meticulously how to transport these goods by air and what goods should be in transit.
