Roll Bars should be installed in every fast car. And not without a reason though. After all, all of us are prone to accidents, particularly when travelling at high speed.. Because in this case, there will not just be a collision but all the passengers will be turned and tossed about, giving occasion for grave head injuries. So roll bar should be fitted so that they close in on the riders and they are prevented from being thrown out of the car or from being tossed around.

Roll bars are actually fitted with a lot of care so that they lock in place at the first impact. Initially this was used in race cars where sue to great speed, most of the accidents are rollovers. Later the model was adopted by other major public car brands as well. But in this case, they are in built and are hence away from the general view. Roll bars in the racing cars are fully visible and one can even hang on to them. In the smaller cars, where full roll cages are not an option, the single roll bar too provides a lot of support that goes beyond the head rest and the back seat. And with modern designing, this is going to be used further for the benefits of the users.

Roll bars can also be installed in cars later but that mean working on the entire body of the car. That can be quite expensive. But it will be worth it if you are faced with an accident. So ensure that they are fitted properly and you would be doing a great service to your family and friends as well.
