Some Features Weâ€™d like to See on the iPhone 5

Sandy

Article published on April 13th 2012 | Mobile Phones

Rumors are abuzz that the new iPhone 5 is all set for a mid-June release. Regardless of the rumors, here are few features that Iâ€™d like to see in the new iPhone 5.

Battery Life: The battery life of an iPhone 5 is a major complaint among all users. Although Apple did try to sort the issue by introducing the iOS5.0.1 update, the performance leaves a great deal to be desired. This is one aspect that should be improved; especially if Apple plans to introduce updated features like Siri.

Flash: Now this is probably something thatâ€™s always going to remain in an Apple fanâ€™s wish list. Ste Jobsâ€™ opinion on Flash is more than likely to be passed onto his successors. Agreed that HTML is a better technology that Flash, but the consumer ought to have what he wants! After all itâ€™s just a phone and not an authority to judge our online media experience.

Better design: iPhone fans may find this blasphemous; but honestly, Iâ€™d like Apple to revert back to the curvier shape, simply because it sits better on the hand! Ever since Apple introduced the square shaped design, people have been begging for a redesign. Letâ€™s wait and watch if their prayers shall be heard when the iPhone 5 is launched.

Faster performance: The A5 processor is fast enough, but weâ€™re talking about the iPhone here. The A5 just isnâ€™t fast enough! Ever since the A5X quad-core processor was introduced through iPad, fans have been expecting a faster processor in the iPhone5. The A6 processor is sure to be better and faster than the current A5 processor used in iPad 2 and iPhone 4S. This is sure to increase performance especially when playing games.

4G LTE: Devices with the latest Windows Phone and Android have switched to 4G LTE for better speed and performance. Itâ€™s time for Apple to switch to the 4G connectivity to enjoy speed that is 10 times faster than the normal 3G connectivity. Thisâ€™ll allow for faster streaming of videos and browsing videos on the go.

Near Field Communications: NFC or Near Field Communication is a platform that allows users to pay through an account that is set up through the phone. Google Wallet is a feature that uses a similar platform. Planning to buy a new pair of shoes? Just wave your phone at an NFC enabled device in the store, and the product is yours! Will the iPhone 5 use this technology? Chances are slim, because if it does, platforms such as these would become commonplace.
