Tips for Making the Right Choice While Purchasing Cheap Airsoft Guns by Adair Sawyer

Article published on March 19th 2012 | Others

There are many different types of airsoft guns which is why you need to know a thing or two if you want to get a good deal. If you are planning to purchase cheap airsoft guns, a few tips can help you understand which model should be picked and which should be avoided. There are three popular varieties of guns, depending on how they are powered. These are the airsoft electric guns, the gas powered guns and the spring powered guns. The spring powered guns have a tight coiled spring and have a clean, simple and fast mechanism. However, they need to be cocked after every shot which slows you down. The electric guns are quite popular because you can avoid cocking after every shot and enjoy the shooting experience.

If you are purchasing cheap airsoft guns, you have to take a look at the construction of the body. ABS high impact resistant plastic is used in some cases while some guns have fake wood and metal look. The weight of the gun will tell you the extent to which metal parts are used. Some people prefer guns with more metal parts because of their durability, while some look for lightweight and sleek guns made of tough polymer. There are both pistols and guns you can choose from. Airsoft electric guns are slightly more expensive than the pistols largely owing to the features and firing accuracy.

A few parameters can help you judge cheap airsoft guns and compare them with each other. The muzzle velocity is an important parameter and is mentioned along with the weight of the BBs used. The airsoft electric guns can give you muzzle velocities as high as 350 FPS with 0.12 BBs or even 0.20 BBs. Cheaper models will give you a muzzle velocity that is substantially lower, around 150 FPS. Another parameter is the firing speed or the number of shots that you can manage which obviously depends on the mode. Some guns come with a switch that allows you to choose between automatic and semi-automatic modes, although there is an additional safety mode available in expensive models. In models like the Glock, there are some impressive features such as the trigger restraint which prevents accidental firing.

The capacity of the magazines which are available with the guns varies as well, with 15 to 60 being the common range. Some kits include an additional magazine and bonus pack of BBs. If you are picking airsoft electric guns, you will have to choose between AA, AAA or Ni-Cd batteries, which may not be available as part of the kits. Rail mounting is another feature present in some guns, which also come with scope and laser for better shooting accuracy. There are sniper rifles too that come with optical mechanisms and a tripod for accurate shooting. Good guns should usually give you impressive blowback recoil and should have a full metal barrel and receiver as well. You may also want to check upon the adjustability of the hop-up for shooting with different BBs if you are looking at cheap airsoft guns.
