The Art of Surviving Air Disasters: Tips for Dummies by Nathan Brown T

Article published on February 16th 2012 | Self Help Techniques

Flying like fast internet can be a thrilling affair, especially if you are doing it the first time. Even if you are a veteran flyer having logged thousands of nautical miles there is always something that you can learn to make them safer than ever before. Simply follow them, and should an accident happen you will still stand some chances of surviving.

1.Normally air accidents donâ€™t happen at high altitudes. Those that happen are usually during takeoff or landing. And that is where the problem lies. If you donâ€™t want to risk an accident donâ€™t fly. If flying inevitable, then think about flying non-stop flights and that way the chances of being caught in an accident is minimized.

2.Bigger aircrafts generally stand a better chance of saving passenger lives when they are caught in an accident. If itâ€™s just before a takeoff then the severity of accident is almost absent unless fire is caused. So before you buy your tickets make sure that you are flying on one of the bigger aircrafts. The tickets may cost you more expensive, but then your life is much more precious that than dollars and that donâ€™t forget.

3.Minutes before a takeoff or a landing you will be given a briefing. Take the briefing seriously and stick to what you are advised. Sometimes there is a clue to an imminent accident and you are being warned. There will be lifesaving jackets and other accessories with which you will need to get familiar. Ask the airhostess, she can advise you about using them.

4.Most big aircrafts have an overhead storage bin that can crash on your head if it is loaded heavily. Be conscious about it right from the beginning of the flight. Ask the airhostess if they can be relocated. If that is a distinct possibility then you are that much safer.

5.Accidents can happen anytime, although the most possible time is during landing or takeoff. But that doesnâ€™t mean you remove your belts off during flights. If you can stand it kept fastened that much is better for you. You can never predict an air accident, not even the pilot for that matter.

6.Donâ€™t keep any hazardous materials with you. Airliners wonâ€™t let them in anyway. But sometimes breach is unavoidable. In case you notice something suspicious or you consider as breach that will jeopardize your safety, let the flight attendant or the airhostess know about it in advance.

7.Love hot drinks while on a flight? Try not to pour them yourself. Ask for assistance from the airhostess. They can help you with a smile on their face. And remember not to drink too much of alcoholic drink. Managing yourself can be difficult should something untoward happen. Rest room cubicles are extremely small even in big aircrafts, and that is also where many in flight accidents too happen. Why buy trouble with something you can do without?

8.Should you get warned about an impending air accident, try to keep your wits intact. Resign yourself to the fact that nothing much can be done by you. Pilots usually appeal to ground control room for assistance, and that you can expect only after you have landed. Scrambling toward the cockpit will only throw the aircraft out of balance and whatever little chance the pilot has in his hands to redeem a despotic situation will be lost too.

9.If your kids are accompanying you let them not panic. To help them not get panicked, first you need to calm yourself. If the only thing that you can do is pray. Do it and accept the facts of life. If nothing else gives you the strength, then prayers will certainly do. Put your life in the hands of the

almighty and relax and hope that the best alone will happen and nothing else.
