Methods on How to Restore Data from Hard Drive by Josephine Yang

Article published on December 1st 2011 | Seo

As the name suggests, data recovery is actually the procedure of recovering data from broken, unsuccessful, corrupted, or inaccessible storage media if this can't be utilized normally. Recovery might be needed because of physical failure or logical failure. Well today we mainly concentrate on data recover hard drive.

Though the hard drive is not the most significant part in a computer, it is likely to be the most crucial part for you. Because it consists of all your data which include every digital picture, every music and video files, all sorts of your programs and so on. Once the hard disk has problems or gets accidentally removed, it may cause serious consequence. Fortunately, you will find methods to restore data in many cases. Below are several steps that would help you recover some data from your external hard disk.

How to Restore Data?

1. First you ought to boot your PC normally with the exterior hard disk attached.

2. Try to download a recovery program and install it on your primary computer drive. Most recovery program will have the feature of Recover erased file and Find lost data. Here please remember that you had better not install anything else on your external drive, since it might overwrite your computer data which will reduce the chances of deleted files recovery.

3. Then what you should do is to perform the recovery program you have installed on your computer. If you accidentally erased files in your external hard disk drive, you can choose the function of Recover erased files. But if you formatted your disk mistakenly or perhaps a system crash broken your computer data, then you are able to choose Find lost data feature. If you fail to discover the drive letter or access your drive, then just choose Find lost drive.

4. Choose the logical or physical hard disk that consists of the lost data. Logical drive is a partition or virtual drive, while physical drive is an entire hard disk.

5. Scan for data with your recovery program. To get back deleted data, you are able to save on your primary system drive. With respect to the health of the external hard disk, you can re-install the information.

6. If the drive has some kind of mechanical problem, this moment you will not do anything but send it to a hard disk recovery service to help you handle this issue.

All in all, for you, the best way to avoid restoring data is backing up all your important data.
