Would you like to know how to retrieve deleted data, photos or documents? It is very common that you accidentally remove some files, photos, possibly even be unaware until after the Recycle Bin or Trash has already been emptied. Or perhaps the hard disk crash forces you to reboot and lose unsaved information. Or it is virus that makes you unwillingly reformat the entire hard disk and re-install your computer system. Anything can happen, so you ought to be aware how to restore data.

You might be surprised to understand the procedure that the Recycle Bin uses. Files, photos or documents placed into Recycle Bin are not really moved. As a matter of fact, these files are re-named and also the Recycle Bin places a marker that links to that original file. With the Restore feature, you can recover deleted photos or files to the initial title. But what if you empty the Recycle Bin?

When you empty the Recycle Bin, in fact the files or photos are not really taken away from your hard disk. Actually they are just invisible. The fact is the computer places a marker on the file. This file informs the computer the space it is occupying is now available. However, what the operating-system does is remove regular access to the file so that it cannot be located by normal search techniques. The space getting used by the file is reallocated and reused by being over written with new data.

When the space in which the erased files are located is used again, then your file isn't retrievable. That is to say you ought to get back deleted files as soon as you can after you remove it. You might try a professional recovery tool to help you, which is more convenient and safer.

MagicCute Data Recovery is such professional data recovery hard drive software, which can complete data recovery in just several clicks. More importantly, it can be managed by all, even for total PC newbies. Below are the main features for MagicCute Data Recovery:
