Home appliances are electrical/automatic equipments which execute a number of domestic tasks, for example food preparation, cleaning etc. Home appliances can be categorized into:

Major appliances or else White goods

Small appliances or else Brown goods

Consumer electronics or else Shiny goods

Brown goods generally necessitate high technological knowledge and skills (which get more intricate gradually) whereas white goods require more practical skills and "monster power" to control the devices and heavy tools are required to mend them.

White goods/major appliances consist of major domestic devices and might comprise: air conditioners, dishwashers, clothes dryers, refrigerators, water heaters, washing machines, microwave ovens and inverters.

An air conditioner (a lot referred to as AC) is a home appliance system or device planned to dehumidify and pull out warmth from an area. The cooling is done by means of a plain refrigeration cycle. In construction, an entire system of heating, freshening and air conditioning is referred to as "HVAC".

Because of an exciting consumer market and large metropolitan residents, consumer appliance products have always been all the rage and in demand in the Indian market. Air conditioners are in more demand in metropolitans than rural areas. In cities for example Mumbai, Delhi, Chennai and Kolkata, the exercise of ACs have turn out to be very important. This is mostly owing to the hot weather conditions of India, counting the scorching summers, that has temperatures mounting up to 37 degrees Celsius.

There are two types of air conditioners in India; the split as well as window air conditioner.

Split AC

As the name imply, one unit is separated into two parts, cooling division is fitted in the room, whereas hot exhaust is outside. Split Ac is high-quality option for workplaces and other business places. Furthermore, it can also be used in those rooms, which have no window for the fitting of window AC.

Window AC

The most universal Air conditioner, which is used for small houses and places of work, is Window AC. It is a cubical component, an entire conditioning system in itself; it requires a window, or such space, where you are able to fix it with its face in the room, and the external part outside the building, as it releases heat outside.

Lastly, except split and window ac, home air conditioners are also popular in India.
