Go Green with Paper Carry Bags by Elissa Joyce

Article published on December 13th 2011 | Shopping

Active awareness for the environment has only actually surged in the past decade, but people are quick to pitch in and help save the planet. With the increase in environmental awareness come the methods of preserving and even restoring nature. Everywhere, one can come across people using plates, cups, and various food containers made of paper, and cardboard, PET plastic, widely known as the best out of recyclable plastic materials and even cloth or paper carry bags.

Why paper? Why PET? Why not simple plastic? What makes this PET thing better than any other kind of plastic? Doesn't paper simply get ruined after one use? Paper canâ€™t be dish-washed!

Paper and PET products are widely used most plastics are not meant for being used more than once, being manufactured only for one purpose before being thrown away, and there's no way to reuse them without using up large supplies of energy, and some plastics are simply not recyclable. Meanwhile, once thrown away and sorted, paper and PET containers can be reused again, to be broken down in the factories and remade into other kinds of items, or back into containers, plates and utensils. Which is better then? Of course, the ones anyone can use over and over again. These are the items that are called environment-friendly.

Other environment-friendly products and methods include the use of solar energy panels, hybrid electric vehicles, energy-saving tactics, children's educational toys and even food and accessories for the family pets. Not only are these products good for the environment, but are also beneficial in the long run, because they are very safe to use and very healthy for people from all walks of life.

However, "environment-friendly" does not mean expensive products. There are paper water cups, paper utensils, PET-grade bottles and containers and cloth grocery bags available in every store, and there are even whole stores and websites wholly dedicated to eco-friendly, wallet-friendly merchandise, because no one should have to make themselves poor to "go green", or help take care of the environment.

The food industry especially uses up large amounts of disposable items that add to the amounts of waste, so it is only natural that caterers and vendors would be some of the first organizations and individuals to make use of these cheap but quality packaging products that are easily reusable. These are so affordable and widespread that anybody can buy and use them.

There are packaging suppliers that provide durable, environment-friendly packaging goods to various food chains, stores and individuals. These suppliers have great services such as prompt deliveries, and customer advice on how to use their products wisely and safely. Best of all, they are indeed honest and reliable, with service crews that are always happy to help. With these services, vendors would not have to worry about their hard-earned money being wasted, and consumers would not have to worry about their food being shoddily wrapped or tampered with.

There are so many more methods of going green, but simply using recyclables such as paper carry bags or cloth grocery bags, the right products, and trash segregation methods will go a long, long way in improving the state of the environment, and lifestyles.
