Recent Breakthroughs in Television Technology by [Julia Roger](#)

Article published on June 9th 2012 | [Shopping](#)

Over the years, television technology has undergone massive improvements. Television sets, which adorn modern households, have outsmarted their predecessors by every measurable parameter. The kind of TV sets manufactured when the technology was still in a nascent stage has become extinct now. The initial TV sets carried convex screens- another major trait, which is no longer there. Due to the screen's convex build, images therein would appear somewhat curved. With passage of time, however, the screens have undergone tremendous modifications. Beginning in 90s, manufacturers started coming out with TV sets having flat and semi-flat screens. The Plasma TV followed next, thereby flagging the beginning of a new era. Domain of the rich and the wealthy during their early days LED television and LCD television slowly and gradually crept into the common person's drawing room.

TV sets in earlier times used cathode ray tubes to display images. The LCD tv, on the other hand, makes use of liquid crystal display for generating images. What you get in result is greater viewing experience coupled with superior quality imaging. Appearance can always be considered as one of television's biggest advantages. Slim and sleek, these lightweight beauties are value additions to any modern home. In addition, to make television viewing as pleasurable as possible, top brands have started pumping out with large screen LCD TV sets. While LCD technology continues to grow in leaps and bounds, the led television sets look all set to don the hat of the next big thing in the market. While LCD and LED television may be similar to each other in a number of ways, there remain but a few major differences.

That LED displays images with higher dynamic contrast than those produced by LCD displays is undoubtedly a major one among them. Secondly, LED sets are much slimmer compared to their counterparts. Eco-friendliness is another area where the LED scores above the LCD. On the flipside though, for all the LEDs pack onto themselves, they are much expensive than the LCDs.
