Replace ATV Parts When Necessary!

Ok, admit it, owning an ATV, also known as a quad, is truly awesome! All the outdoor fun you and your adventurous family can have riding around on the ATV, whether it is for the speed or just to go sightseeing. But, just like anything in life, you will have some maintenance on an ATV. At some stage something will have to be repaired. Maintenance is really an essential part of owning an ATV, since it could make the difference between safe driving and landing up in a unsafe situation or incident.

There are so many different parts that should be checked on your ATV regularly, but here are some of the most important parts of your ATV to check:

Tires: It is important to check your tires frequently. Make sure it is properly inflated. It is extremely unsafe for the tires to be over-inflated or under-inflated considered as it may cause a blow out. You can probably check the tires every time you fill up the gas, as it only takes a couple of minutes. Also, be sure to replace the tires if they are worn or cracked. Worn or cracked tires may result in a flat at the time you least anticipate it. Cracking may happen from regular usage over years or from long periods of storage. When wearing starts to show around the edges of the tires, that is a obvious sign to replace it.

Brakes: You will usually find Two brake fluid tanks on a ATV, the one being on the front and the other at the back. Ensure that you check both on a regular basis and fill them up as necessary. Always fill up by using a closed bottle, considered as brake fluid will probably absorb moisture and be less effective. Also make sure you check the thickness of the brake pads and replace them when necessary. If you fail to and the pads go right down to the metal, you will risk damaging your brake disc. Brake discs are usually an expensive part of an ATV.

Fuel: It is common sense to regularly check the fuel, but the fuel filter and fuel lines are usually overlooked. These are usually important parts of the ATV and needs regular maintenance. The fuel filter must not be clogged and always look clean, and needs to be replaced every 2 years. Fuel lines may get weather damage, and should be checked for cracks and replaced as needed. Make sure to turn the fuel tap off to prevent fuel from actually leaking out and flooding the engine if your ATV is in storage for a while.

These are only a few, but very commonly over-looked parts of an ATV which should regularly be checked. By maintaining your ATV you could save yourself a lot of money on unnecessary repairs.
