Tips for Buying 3D Home Theater

by Jon Smith

Article published on January 3rd 2012 | Shopping

Home theater is a combination of audio and video equipments that bring real cinema experience to your home. Home theaters bring entertainment to viewers similar to that of cinema hall at the comfort of their own home. With home theater, people can watch their favorite movies or shows with much more excitement than ordinary television. Nowadays, most of the major manufacturers of home theaters offer a wide range of 3d home theaters at various price points.

Branded 3D home theaters usually have multichannel power speakers, amplifier, receiver, FM tuner, woofers and media playback. With their great video performance and surround sound environment, these home theaters truly enrich your entertainment experience. In the given articles, we have explored few features that will help you to buy a better 3d home theatre.

? Whether your budget is large, small or moderate, still the size of the room in which you are planning to place your 3d home theater matters a lot. For many of us, buying a home theater is like one time or long time investment and we want to acquire the most durable one. Thus, it is important to choose one that best fits into your room. It is advisable to buy 3d home theatre having diagonal screen size not larger than about half of your seating distance. You should also consider size ideal for speaker and amplifier placement, so it should allow you to enjoy blu-ray displays, HD-DVD displays and other high definition displays.

? HDMI element is important for best sound and image quality. It is advisable to look for HDMI or component video inputs that can produce best possible picture quality. Your home theater should also have audio video inputs such as composite-video and S-Video inputs to support sources such as VCRâ€™s. You should also look for features such as USM media host. With USM media host, you can connect your digital music, photos, and videos conveniently with your 3d home theater system.

? Your home theater should also be compatible to meet formats like blue ray disc player. Blue ray disc is an optical disc format that produces the best picture quality for an HDTV and stores high definition video and games.

? You should also be careful to notice that your initial speaker-wattage is high, and the sub woofer wattage is at least its double. If you don't want to spend much money, you can buy 3d home theatre with center, left, and right speakers and can later buy sub woofer for extra bases.

? One should also consider performance of receivers of a home theater. They help in processing, switching and amplification. Nowadays, most of the receivers can decode important formats such as Dolby Digital and DTS. About 50 to 100 Watts per channel is quite enough power for 3d home theatre.

? A prudent buyer must always look for return policy and warranty before buying home theater so as to get better value for his/ her money.

Hence, with a little more careful step, you can buy 3D home theater and can enjoy real cinema at your home as per your own convenience.
