Tips for Installing Telephone Extension Cable by Maarktron

Article published on January 19th 2012 | Shopping

There is always demand for telephone extension cables, though you have many in your office. You have several choices when it comes to telephone jack installation. Several house-owners do it on their own the entire installation process of jack. It is easy and simple to draw additional lines to second bedroom or any other room in the house using the extension rod. The application of automation has made it simple to install any number of phone connections in the house and is cost effective and beneficial to the user.

The cord of telephone wire generally is available in 4 stranded wire and 6 stranded wires. In some offices they use 8 stranded wires also for easy access. A stranded wire contains set of pairs of colored wires through which connection is given to the cable. You can see 4 different colors in the cable such as green, red, yellow and black in a typical 4 stranded wire. It is true that standard telephone wire contains 2 or 4 stranded wires unlike 6 and 8 stranded wires. Make it a point to choose only 2 stranded connection if you are using single line telephone. In case you are using 4 connector, the two contacts outside is not used.

Now, let us go into the process of installation. First, you have to remove the cover of the cable, where you will see the connector and other terminal screws. Also, there are 4 colored wires present inside the connector. Now, make connections using the green and red colored wires to the terminals. It is quite common that most of the homes use red and green colored wires for connecting to hot lines however in some houses they make connections using different colors. Now after making the connections, you can verify whether you have done it correctly using the phone tester device. Also you will not get a dial tone, if you are connecting the wrong pair of wires.

Use the telephone extension cables for giving second line connection. You can use the remote device for attending the call from the master bedroom or even in your kitchen. For doing this, you have to activate the connection in the remaining set of wires, namely black and yellow colors. By using the cables you can make connections with headset also. These chords allow you movement to various rooms in your house and hence you get total freedom in using the telephone. In case, you encounter any problem, you can call the service engineer for attending it.
