Android app development - Points to ponder by Angel

Article published on February 14th 2012 | Software

Android has become an alluring platform that has opened the floodgates, and the many applications churned out by aspiring developers elucidate the appeal created by this platform. Though end users can take their pick from among a variety of apps, it is the robust app that attracts the immediate attention of the target audience. In effect, enthusiastic developers involved in Android App Development program ought to consider several elements before creating a useful application. There are some queries that need to be answered to ensure that a development team builds an effective app in the bargain.

What is a useful app?

In the first place, the Android app development team that aspires to bring out an effective application should strive to build a useful application for a client. An app that is built just to advertise a product doesn't earn recognition amid users, as an application should offer unique information or service to capture the attention of the target audience. In simple terms, the end user would pick a tool that is useful to him, and aspiring developers ought to keep this mind when they take steps to create Android apps for end users.

Does the app promise longer usage?

In most cases, an effective app that attains popularity amid target audience is a tool that lures users to reuse the tool at regular intervals. Android apps that don't promise longer usage don't attract user confidence, and the development team has to take care to build apps that lure customers to have innumerable interaction with the developed app.

What is the application built for?

Needless to say, the dire need for an application impacts the success of an app, and the development team ought to weigh this feature before venturing to develop effective Android applications. When the app is built for a brand that boasts of products with longer life cycle or for a fashion company, the application brings immense benefits for both the user and the company. The reason for which an application is built can produce a telling impact on the success of an application.

Does it create positive user experience?

End users look for an app that is easy to use and that paves the way for a positive user experience. The development team that is involved in creating alluring applications ought to take note of this fact, and ensure that a well-designed Android app is created to offer rich user experience as well as engagement.

While the development team is involved in Android app development project, it should take note of important aspects to build effective apps in the process.
