Article published on February 17th 2012 | Software

No matter newly purchased system works fast for a few months. Unprecedented performance and visuals pamper your heart from the bottom. Blockbusters and beats give reasons to shake hips, and flaunt about its oomph factors. Gradually, time progresses, and after weeks, months and years, your perception begins to change. The PC pranks upon you, and irritates you often, as you have to hold breath to get the programs and files opened. Internet speed takes out your patience. All of a sudden your machine becomes the abode of errors and issues, and its hostile behavior gets on to your nerve. Remember, computers are designed to speed up work; technology should serve you, not the vise-versa. Slow performance issues can happen with any machine irrespective of its make and model. At times, you are oblivious of the facts that are responsible for this peculiar behavior of the system.

This â€œSpeed up My PCâ€• article has been written to provide quick and easy solution for bleeding system. Firstly, evaluate causes that are ruining the speed of your machine. Most noticeable includes Windows incompatibility, low memory, unwanted visuals and startup items, virus and malware infection, presence of more than one antivirus or security software, cluttered hard-disk and more. Getting additional memory means to invest. However, there are free PC optimization methodologies that can resolve the performance issues easily. Read ahead and do it yourself.

Have you ever thought which Windows version to install? Going with the crowd wonâ€™t give you the expected result. Whenever a new Windows version comes, it is accompanied by some sorts of Windows Advisor tools that can evaluate system configuration and instruct you accordingly. Run this software, and once you are affirmed take further steps to install or upgrade the system software. Be specific about the architect of the OS viz. 32 bit or 64-bit so as to suite the motherboard. Post-installation, equip it with the right drivers and firmware. Disable unwanted visual feature of the OS, if they donâ€™t embrace you.

Despite all, in long run the machine slows down. Pretty similar as the toxic components like CO2, urea, etc. related to metabolism when get assimilated inside body for long time can cause problems, installation, uninstallation, update and upgrade of applications give birth to broken registry entries and temporary files that can create conflicts while computing. Moreover, they share unwanted memory and compete with respect to resources. Computer maintenance tools such as Disk Defragmenter, Disc Cleanup, Windows Event Viewer, registry settings available with the OS can help you to check and fix slow computer issues. If computer viruses, spyware and malware are impairing system resources and errors are taking the hold of your computer then itâ€™s time to scan your machine using a reliable third-party security software or Microsoft Security Essentials. Probably the cause is an indication that the security software that you have on machine is not up-to-date, so better will be to get it updated. To check slow Internet issues, keep deleting the web cache, cookies and temporary Internet files on regular Interval. By clearing the web cache you cut down on the work your PC needs to do thus speeding up your slow internet connection.
