Basics for developing iPhone Apps

by Roger Lopez

Article published on February 10th 2012 | Software

Developing a great iPhone App could help you make money but there are several factors that have to come together to make it. It is just not creativity that matters while developing an app. You can conduct some study of your own to understand what apps have worked and what has not before. Even within apps, look for options that can be tweaked a bit make the user experience better.

To develop iPhone Apps, you definitely need the right tools. One has to join the Apple iPhone developer program to begin with at all. Then, you have to sign a non-disclosure agreement, and the Xcode tool to build the application. The software development kit (SDK) from Apple will be an additional advantage. As iPhone and Macs are products of the Apple, working with Mac is a logical choice.

Handling all the aspects that are required for the development of an iPhone application may be hard for one to tackle alone. So, assembling a team is a wise idea for the completion of the whole process. Starting with an idea, you have to take the help of others to turn it into a real application that a user will find irresistible to buy. A large number of skills are involved in making an application, including knowledge of the ground realities of the application market which is to say what works and what doesnâ€™t. Then there are others such as sitemap creation, sketching and GUI designing as well. Programming using Objective C, Cocoa needs to be known. It is a team work but remember signing a non-disclosure agreement is very vital to assure that your idea is not stolen; hence it must be done with every member of the team.

Other than this, you must know whom it is meant for. You have to be clear about the target audience after doing the market research. Whether your application is a game, a utility application or just something fun, just be clear! Sketch out a plan of action that tells what information should be present on the screen. The size of elements and how the user can move from various points of the app should be clearly pointed out.

Hire a programmer if you are not so sure of using Objective C, Cocoa to program your app. If you are, then you can get started by opening the Xcode. Tell the programmer what kind of application you need to develop iPhone App.

When the application is ready, submit it to the Apple Store and complete all necessary formalities. Promoting the app through any forms including social networks is just as essential as anything. Creating a buzz before its release to make better impact is a clever marketing strategy.

The process to develop Android app for the new Verizon Droid phone is somewhat similar to that of developing Iphone Apps. Professionals have lauded the Android operating system for its stunning simplicity to develop Android Apps, its execution and its usage. Today, many are eager to know more how Android app development platform has to offer the world of smartphones.
