Being Aware of the Functionality Involving LDAP Proxy by John Ozoa

Article published on March 9th 2012 | Software

LDAP proxy increases the layer of protection between LDAP enabled client applications and back-end information repositories. This way, you will be able to improve the efficiency as well as failover capabilities or modify the presentation of information stored within your repositories in real time.

It comes with built-in features and functionalities in addition to plug-ins making it one of the most significant and effective components that you can incorporate into your current infrastructure of directories. This can be used as well in many configurations to resolve any problem that could be associated with the LDAP back end repositories.

There are particular features that the LDAP proxy has. Aside from acting as LDAP firewall, it has many other capabilities that make it essential in your virtual directory environment. To begin with, it gives virtual unified views of information which you store within multiple back-end LDAP repositories. It enhances performance on connection pooling and load balancing mechanism. It also comes with health checking and failover algorithms that enhance accessibility.

There are other impressive benefits that LDAP proxy can bring to your organization. First of all, it can give you the capability to perform fast and efficient modification of information presentation in genuine time in order for you to add new applications to your existing infrastructure without having to change information or information in the directory. This only indicates that the information is not unchanged keeping it in its original format and location.

This proxy also delivers speed, exceptional security and protection on information and at the same time lets you use it with ease. It is also a cost successful solution because it comes with plug-ins and built-in capabilities. Businesses and organizations can rely to it because it is equipped with new features created to make it simple to use and deploy.

Getting an LDAP proxy in your VDS or virtual directory server is helpful because it allows you to ensure the protection and security in your environment. You need not to worry in case a person attempts to access or change any of your information for they will not be able to do that as you have LDAP proxy set up in your server.
