DVDs are the best storage media to use for the purpose of playing the movies, TV shows, documentaries and video music albums. Digital Versatile Disks or commonly known DVDs are considered to be the most suitable video format carrying the videos for porting the movies around the world. These are the optical disks that make it possible to publish the digital videos at very low cost for the distribution of the videos around the world. Videos that are in present on these disks are in VOB format. The VOB format is one of the most famous formats around the world that is dedicatedly used for carrying the videos in the DVDs.

Mostly we prefer to have a DVD instead of downloading a video file that needs more time to play on the computer. These disks are also supported on the DVD Players to play such files on the TV to enjoy a 3D, animated movie on the large screen LED TV. These are the videos that are in high definition format that are present on the physical sectors and tracks of the disk. Digital disks are capable of occupying huge size data files this is why; these disks are preferred to carry high definition videos on the disks.

Although these disks are very useful to play the videos on the computers (personal computers and laptops) and DVD players, still there are numbers of some limitations that make these DVDs unplayable in some circumstances.

â€¢ A user who wants to play the videos on the computer but do not have a DVD player utility program, he cannot play these videos because VOB format is not supported by most of the media players specially default media players like Windows media player and QuickTime media player for the Mac operating system.

â€¢ A user who wants to play the videos on his IPAD, IPOD or IPHONE to play his favorite movies on his portable and hand held devices. These devices cannot play the disks because these donâ€™t have proper equipment like DVD-ROMS.

â€¢ A user who wants to edit his favorite movies to exclude the unwanted video contents from the video file. He cannot edit the pictures because these disks do not permit users for such writing privileges.

â€¢ A user who wants to share his favorite videos with friends and family members using the virtual environment on the network either a peer to peer network in which only two devices are connected to each other or using the internet that is a network of networks.

In these entire situations, DVDs are not been able to support users in fulfilling their needs. The appropriate and most effective solution is to extract the videos and to convert the videos into playable formats. If you are a Mac user the most preferred choice is MOV format for playing, and sharing the videos using Mac media player applications and Mac devices. It is an inherently supported format from the Mac media players. iSkysoft DVD Ripper is the best application that facilitates users to rip a DVD to MOV format.
