How to choose patching cabinets by David Hopes

Article published on April 18th 2012 | Software

Patching Cabinets are used to house Patch Panels so that they remain protected and organized. These cabinets are fitted with fixed depth racks and supplies with door. For keeping your Patch Panels well-protected you need to have patching cabinets so that they remain in good condition and last longer. You may need to buy these cabinets and other network supplies for keeping in your house or business places. Before choosing such cabinets take considerations of a few things so that you can choose the best one for you.

How to choose patching cabinets:

Before choosing your patching cabinet consider a few things like, size of the cabinet, depth, weight, etc. so that you can select the one that suits your requirements. The depth of most of the patching cabinets is indicated in 'u' where 'u' equals to 44.45mm or 1.75 inches. Generally 1u refers to 24-port switch or patch panel. The depth of the cabinet indicates the number of units a patching cabinet can accommodate. You can get Patching Cabinets of various depths like 4U 375mm, 4U 270mm, 6U 270mm, 4U 220mm, 6U 255mm.

The patching cabinets come with solid back, lockable door, welded construction and adjustable feet.

Before buying your patching cabinet, make sure of the size of the space where you intend to keep the cabinet. It is important to know that the internal and external measurements of the cabinets vary, therefore, make sure whether the external measurements is perfect to adjust it in the space intended for it.

The slimline style cabinets come with high quality black finish, welded construction, lockable door and top and bottom cable extension.

Before choosing the patching cabinets for you make a good research of various cabinet and rack manufacturers so that you can choose the one which is of high quality, durable, convenient and comes at affordable prices.

The depth of patching cabinets has changed in the recent time and the manufacturers are mostly making the cabinets which are lot deeper but shorter in height. Along with the depth of the cabinet it is also important to make considerations of the width of the door.

The weight of patching cabinets is also important as different cabinets of various sizes come with different weights and they have different load ratings.
